Day 10: One amount, more than one name

Name _____ Date _____

I can show that one amount can have more than one fraction name.

Warm-up.

618 + 257	**804 − 368**	**7 × 6**	**9 × 8**

Example 1. A strip is cut in halves, and $\frac{1}{2}$ is shaded. Fold each half into 2 equal parts. Then fold each part in 2 again. Name the shaded part each time.

1/2 = ___/___ = ___/___

Each part was cut into ___. There are ___ times as many parts.

Example 2. A strip is cut in thirds, and $\frac{1}{3}$ is shaded. Cut each third into 2 equal parts. Write the new name.

1/3 = ___/___

Each part is smaller. The length is the same, so ___ = ___.

Fold and record. Fold or lay your strips first. Then write.

1. Shade $\frac{1}{2}$ of a strip. Lay it on the sixths strip. $\frac{1}{2}$ = __/6
2. Shade the whole halves strip: $\frac{2}{2}$. Fold each half in 2, then in 2 again. $\frac{2}{2}$ = __/4 = __/8
3. Shade $\frac{5}{6}$ of the sixths strip. Cut each sixth into 2 equal parts. $\frac{5}{6}$ = __/12

Fix it. Each answer is wrong. Say what went wrong. Then do it right.

1. Lu shaded $\frac{1}{3}$ of a strip. She cut each third into 2 equal parts. She wrote $\frac{1}{3} = \frac{1}{6}$.

   What went wrong: _____

   Right: ____ = ____

2. Mo shaded $\frac{3}{6}$ of a strip. He cut each sixth into 2 equal parts. He wrote $\frac{3}{6} = \frac{6}{6}$.

   What went wrong: _____

   Right: ____ = ____

Challenge. Lay the fourths, sixths, eighths and twelfths strips under the halves strip. Write every name for $\frac{1}{2}$ you find.
